

Day 01 - Working Environment & Git Setup Report

Name : Abdul Hadi

Epitech Email: Abdul.hadi@epitech.eu

Date: September 21, 2026

Repository: git@github.com:hadi-ce04/epitech-first-ses.git

1. Executive Summary

This report summarizes the setup and completion of the Day 01 Preparation Bootcamp tasks. The objective of today's activities was to establish a fully functional Linux working environment, configure SSH-authenticated Git submission pipelines, master basic shell navigation and file manipulation, and set up mandatory project directory structures.

2. Task Completion & Technical Details

Task 1: Working Environment Setup

- **Network & Systems Verification:** Verified connection to the IONIS network, checked week schedule via "My" portal, verified Microsoft 365 / Teams access, and confirmed local working path using pwd.
- **Editor Configurations:** Verified basic file creation, editing, and saving across four standard editors:
 - **VSCode:** Created and verified vscode_test.txt.
 - **Nano:** Configured and saved nano_test.txt.
 - **Emacs:** Configured and saved emacs_test.txt.
 - **Vim:** Configured modal editing and saved vim_test.txt.

Task 2: Git Authentication & Configuration

- **Key Generation:** Generated a 4096-bit RSA SSH key tied to the official Epitech email address (~/.ssh/id_rsa).
- **GitHub Integration:** Successfully linked the public key (id_rsa.pub) to the GitHub profile and enabled Single Sign-On (SSO) authorization for the Epitech organization.
- **Global Identity:** Configured global identity flags using git config --global user.name and user.email.
- **Repository Cloning:** Successfully cloned the daily project repository via SSH.

Task 3: Shell Commands & File Manipulation

- **Task 2.1 (Basic Operations):** Created directory 01/ and moved task2.1 into the directory using standard shell primitives (mkdir, touch, mv).
- **Task 2.2 (Directory Listing):** Formulated the command ls -mp --hide="*" inside task2.2 to output non-hidden, comma-separated files with directory trailing slashes.

- **Task 2.3 (Permissions):** Updated executable permissions across all user scopes using `chmod a+x task2.2`.
- **Task 2.4 (Directory Tree Structure):** Replicated the required nested artist and album directory structure under task2.4/. Added a hidden `.gitkeep` file inside the empty Soundtracks/ directory to ensure empty tracking under Git.
- **Verification:** Validated tree layout against the required formatting using:

Bash

```
tree -FQ --charset=ascii task2.4
```

3. Verification & Repository Delivery

All files were staged, committed, and pushed to the remote GitHub delivery repository:

Bash

```
git add .
```

```
git commit -m "Complete Day 01 tasks"
```

```
git push origin main
```

Repository Status: Clean tree, all remote pushes verified.

4. Key Learnings & Observations

- Practiced key file and directory navigation strictly through keyboard-driven terminal workflows without GUI assistance.
- Learned the necessity of `.gitkeep` files when tracking intentionally empty directory paths in version control.
- Explored SSH key single-sign-on (SSO) grant requirements within GitHub organizational environments.
